

Setup

This tutorial is the prerequisite to use all the features of the Platform. It covers basic connectivity (UI & SDK) and the steps to create an project and an environment.

Prerequisites

- **Python 3.9 or higher** is required to be installed on your computer.
- We strongly recommend the use of **Google Chrome browser** to use the UI of the platform.

There are 2 ways to access the platform:

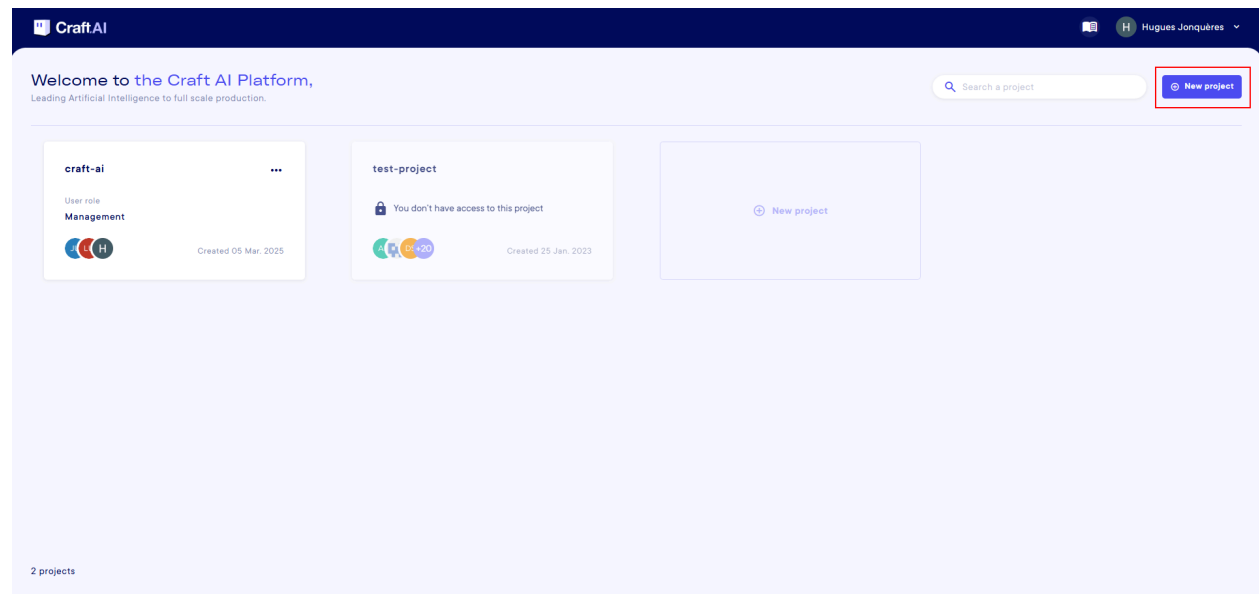

- With the Python SDK, with scripts or command line
- With the web interface, in a browser

You will need both ways to create complete workflows.

Project & Environment creation

Please, follow the link that was provided to your Platform and connect yourself using your preferred connection method.

First, you need to create a [Project](#). In the UI, when you arrive on the main page, you have a button in the top right corner to create a "New Project".

You need to fill 4 main parameters to create a Project. Two of them are filled by default, **Organization** & **Python version**. You just need to choose a Project name and to select the folders the platform will access. Set it to **/** for now (you need to click on the **+** icon or press Enter).

General

Define the general parameters of your project.

Organization *

craft-ai

Project name *

project-name

Python version * ⓘ

3.9-slim

Git connection

Connect the Git repository dedicated to the project.

Repository URL ⓘ

git@...

Deploy key ⓘ

Enter the deploy key of your repository

Default branch ⓘ

Enter the name of your default branch

Folders * ⓘ

src/example

+

Cancel

Create project

Then, once inside the project, you can create an [environment](#). Click on the "New environment" button on the top right corner.

CraftAI

EnvironmentsData storePipelinesExecutionsMonitoringSettings

Environments

Build and manage your computing and storage infrastructures in the cloud.

New environment

You have not created any environment.

It's time to get started!

[Go to the documentation >](#)

You need to fill :

- Environment Name : your choice
- Tag : **Testing**
- Cloud Provider : **Scaleway**
- Machine : **CPU - CPU Size 1**

You can leave every other parameter as default for this tutorial.

General

Define the general parameters of your environment.

Environment name * environment-name	Tag * Testing
---	-------------------------------------

Computing resources

Choose the right cloud provider and infrastructure size for your project needs.

Cloud provider *  Scaleway	Zone * France
Machine * CPU CPU - Size 1	Workers * 1

Storage resources

Choose the data storage technologies to add to the environment.

Data store provider  Scaleway Object Storage	Vector database provider Select a vector database
--	---

Once you click on "Create environment", you will see the environment being created. You can refresh the page to check the status. It takes around 5 minutes for the environment to be created and ready to use.

environment-name URL: https://happy-kivluq-pink-pi-8.integration.craft.ai IP: CREATING TESTING  CPU - Size 1	 Your environment is being created. You will see it appear here when it is ready.
---	---

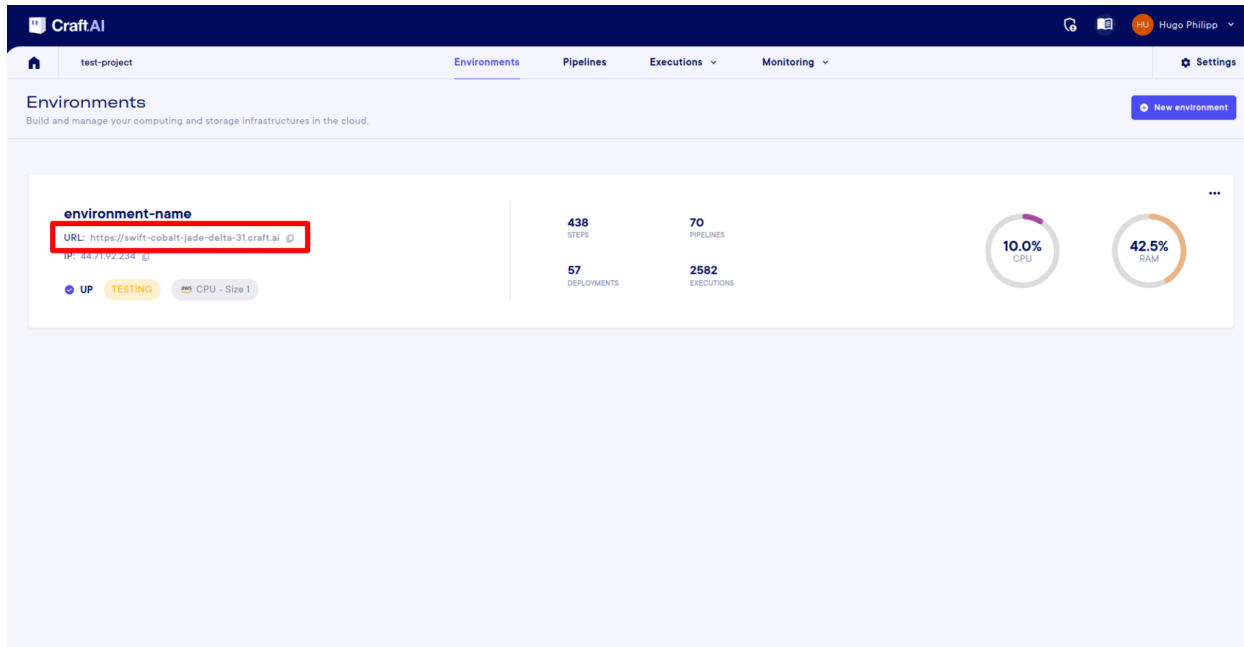

Initialization of Python SDK

To initialize the SDK, you need to install the SDK.

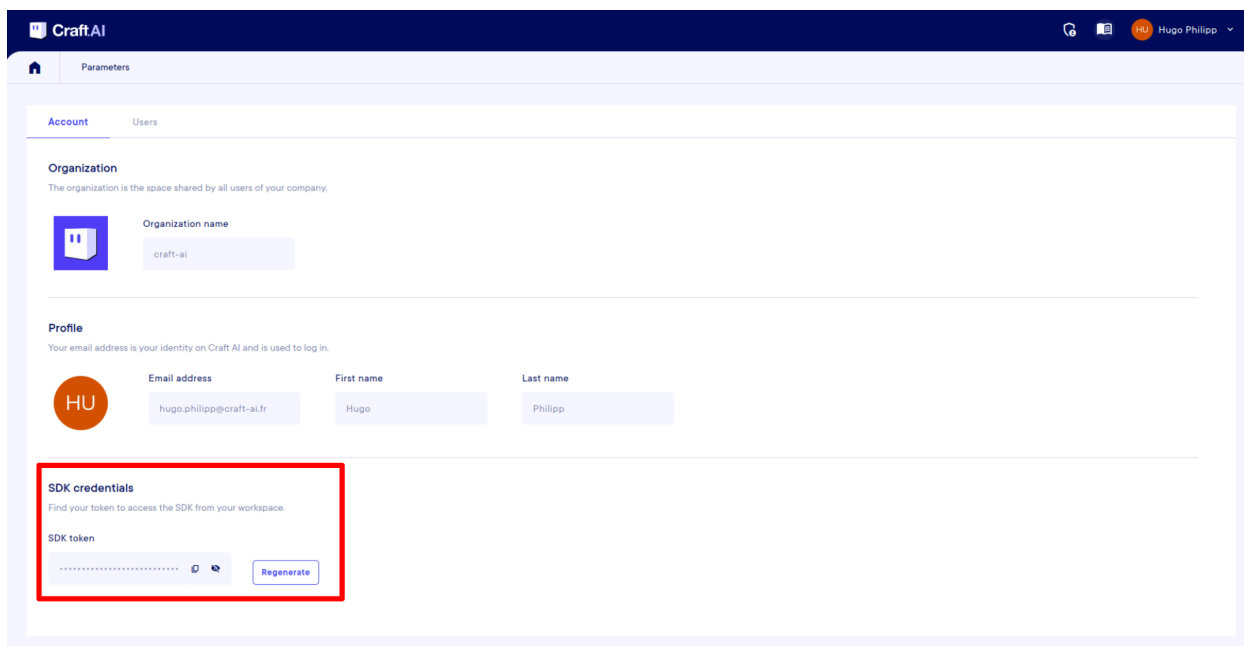

```
pip install craft-ai-sdk
```

You need to find two information :

MY_ENVIRONMENT_URL : You can find this URL on the Environments page in the UI. The Environment URL is NOT the address of the page in your browser.

MY_ACCESS_TOKEN : On the UI, click on your name in the top right corner, then go to the “Parameters” page. There, you can generate and find your SDK token at the bottom. The SDK token is strictly personal. You must keep it confidential.

And to set the value of `environment_url` to your environment URL instead of `MY_ENVIRONMENT_URL` and `sdk_token` to your access token instead of `MY_ACCESS_TOKEN` in the following script:

```
from craft_ai_sdk import CraftAiSdk

sdk = CraftAiSdk(
    environment_url="MY_ENVIRONMENT_URL",
    sdk_token="MY_ACCESS_TOKEN"
)
```

Finally, run your code in a terminal/notebook.

Set up your credentials with a `.env` file"

A good practice would be to create a script that contains the setup of these 2 local environment variables. For example, you could create an `.env` file. We strongly recommend doing this part.

1. Install relevant python packages

```
pip install python-dotenv
```

1. Create a `.env` file.

File tree

```
.
```

```
├── .env
```

```
└── my-sdk-script.py
```

`.env`

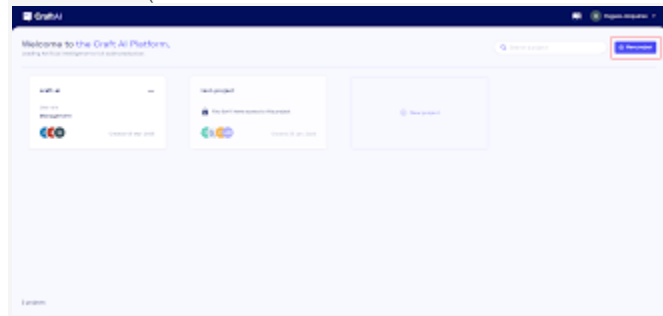

```
CRAFT_AI_ENVIRONMENT_URL=MY_ENV_URL
```

```
CRAFT_AI_SDK_TOKEN=MY_ACCESS_TOKEN
```

1. Execute the following Python code to set up SDK Python object.

`my-sdk-script.py`

```
import os
from dotenv import load_dotenv
from craft_ai_sdk import CraftAiSdk
load_dotenv()
sdk = CraftAiSdk(
```

```
environment_url=os.getenv("CRAFT_AI_ENVIRONMENT_URL"),
```

```
sdk_token=os.getenv("CRAFT_AI_ACCESS_TOKEN")
```

```
)
```

Success

🎉 Well done! You're ready to execute your first code on the platform!
